

Biostratigraphy

The in-house team of biostratigraphers have over 200 years cumulative global experience, with particular expertise in the North Sea, West of Shetlands, the West African margin, the Southern Atlantic, North Africa, East Africa, Latin America, Eastern Europe/Black Sea, the Caspian and the Indian sub-continent. We provide detailed well-log sequence stratigraphic interpretations (the recognition of maximum flooding surfaces, sequence boundaries etc.) on wells analysed, offer wellsite biostratigraphic services (including acid

and acid-free palynological analysis) and have comprehensive in-house laboratory facilities.

What we provide

- Detailed, integrated post-well micropalaeontological, nannofossil and palynological analysis of exploration, appraisal and development wells
- Palaeobathymetric and depositional interpretations
- Integrated regional and basinal review studies
- Worldwide offshore and onshore well site analysis / biosteering
- Slope stability studies to aid site investigation services
- Training for state oil companies / majors / public institutions
- Laboratory biostratigraphic processing for clients
